1--Offensive Security Intro Room- Practise TryHackMe

It involves breaking into computer systems, exploiting software bugs, and finding loopholes in applications to gain unauthorized access.

Goal- understand hacker tactics and enhance our system defences.

In Hacking my First Machine

Tool Used:

- **Gobuster**

We use a **command-line application** called "Gobuster" to brute-force FakeBank's website to find hidden directories and pages.

Gobuster will take a list of potential page or directory names and try accessing a website with each of them; if the page exists, it tells you.

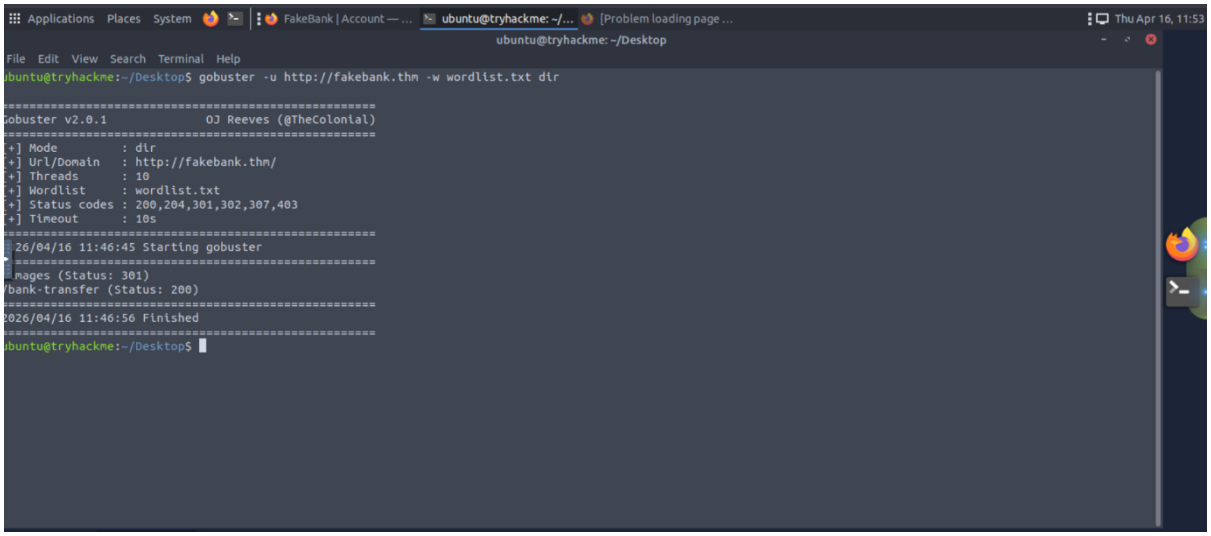
Step 1. Open A Terminal in Kali Linux

Step 2. Use Gobuster To Find Hidden Website Pages

Type the command into the terminal to find potentially hidden pages on Fakebank websites using Gobuster

gobuster -u http://fakebank.thm -w wordlist.txt dir

output :



Gobuster will have told you the pages in the list of page/directory names (indicated by Status: 200).

-u is used to state the website we're scanning, **-w** takes a list of words to iterate through to find hidden pages.

Findings:

- /images (Status: 301)
- /bank-transfer (Status: 200)

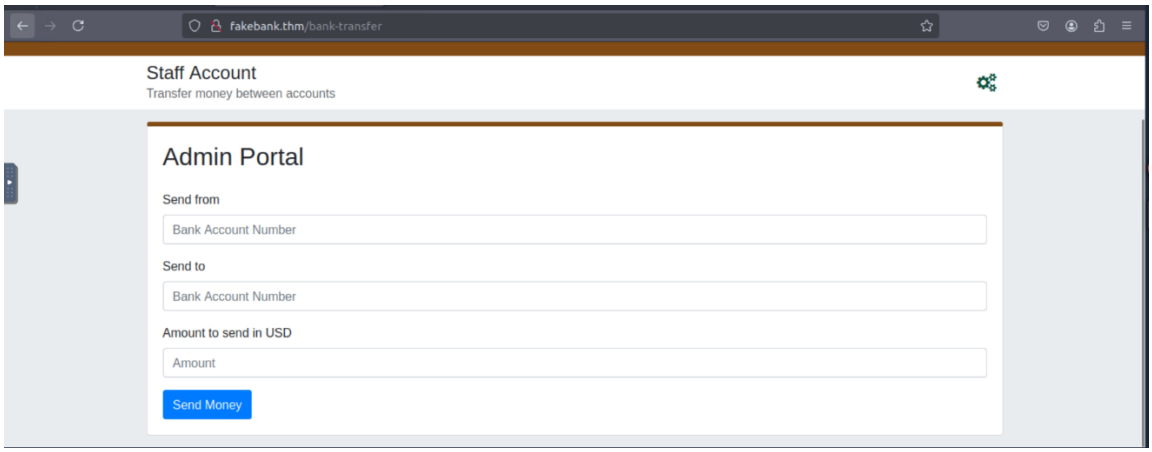
Step 3. Hack The Bank

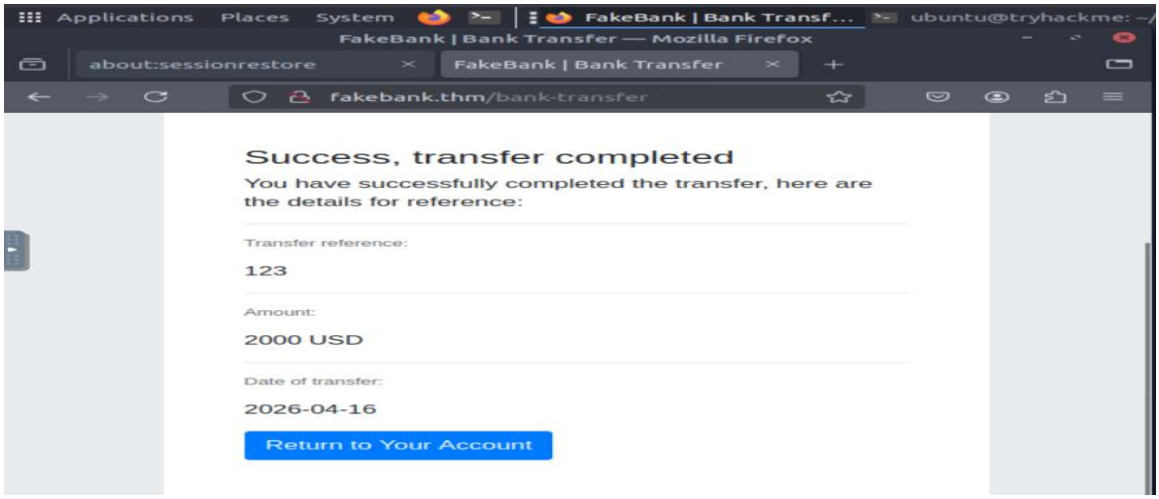
Found a secret bank transfer page **/bank-transfer**

Type the hidden page into the FakeBank website using the browser's address bar.

Through this we can access the page .

And an attacker has authorized access and can steal money from any bank account.



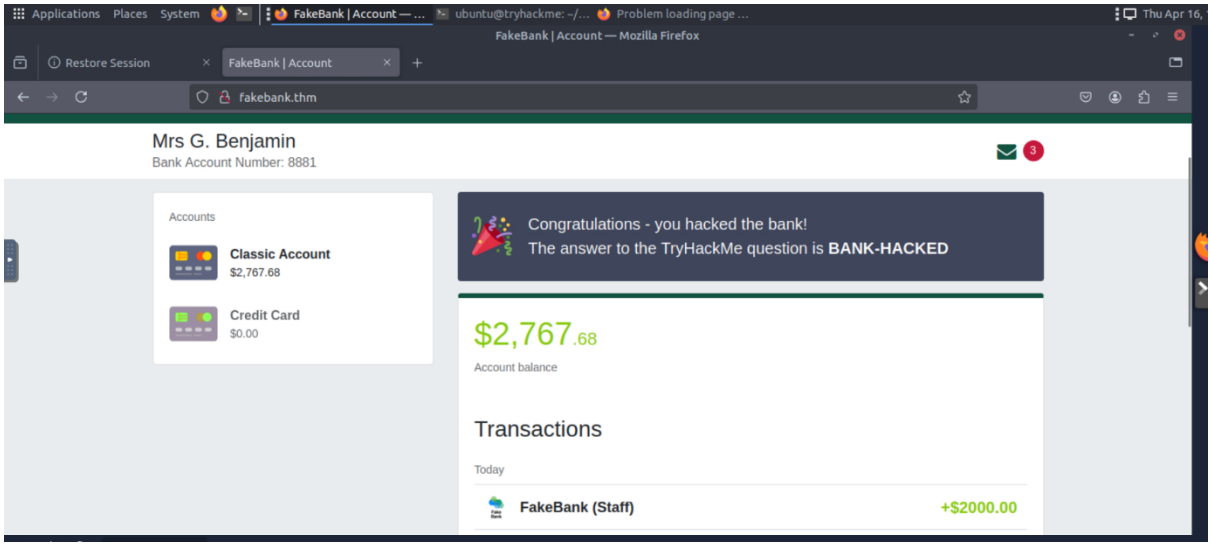


Now we will transfer $2000

Entered:

- From Account: **2276**
- To Account: **8881**
- Amount: **2000**

Vulnerability:

- Broken Access Control
- Admin page accessible without authentication


Output:
